

Special Issue on Research on Cement

Call for Papers

A cement is a binder, a substance that sets and hardens independently, and can bind other materials together. Cements used in construction can be characterized as being either hydraulic or non-hydraulic. Hydraulic cements harden because of hydration, a chemical reaction between the anhydrous cement powder and water. Thus, they can harden underwater or when constantly exposed to wet weather. Non-hydraulic cements do not harden underwater, for example, slaked limes harden by reaction with atmospheric carbon dioxide. The most important uses of cement are as an ingredient in the production of mortar in masonry, and of concrete, a combination of cement and an aggregate to form a strong building material. The goal of this special issue is to provide a platform for scientists and academicians all over the world to promote, share, and discuss various new issues and developments in the area of **Research on Cement**.

In this special issue, we invite front-line researchers and authors to submit original research and review articles that explore **Research on Cement**.

Authors should read over the journal's [Authors' Guidelines](#) carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal at [Paper Submission System](#).

Please kindly notice that the “**Special Issue**” under your manuscript title is supposed to be specified and the research field “**Special Issue — Research on Cement**” should be chosen during your submission.

According to the following timetable:

Submission Deadline	October 16th, 2013
Publication Date	December 2013
